Supercharge Your E-Commerce with AI

Power Pages + Copilot Studio + Microsoft Foundry in Action

Power Pages

Copilot Studio

Azure AI Foundry

Dataverse

David & Samir

Level 300 · Advanced · Technology

Sound familiar?

Customers search manually — and give up.

They open 6 browser tabs to compare products.

They abandon the cart because they had a question — and nobody answered.

You built a beautiful Power Pages site. The data is in Dataverse. But the buying experience is still 2015.

What if your site could think — and act — for your customers?

What You Will Learn Today

A 45-minute journey from store to intelligent assistant

01

**The E-Commerce
Foundation**

Power Pages store ·
Dataverse · Shopping cart

02

**The Shopping
Assistant**

Copilot Studio agent ·
DirectLine SDK · Context
variables

03

**DEMO: Product
Search**

AI-powered product
discovery with Copilot
Studio

04

**The Comparison
Engine**

Microsoft Foundry agent ·
Side-by-side intelligence

05

**The Future:
WebMCP**

Where Microsoft + Google
are taking this next

Act 1: The E-Commerce Foundation

Building the store before we make it smart

The Full-Stack Architecture

Everything talks to everything — here is how

Act 2: The Shopping Assistant

Copilot Studio meets Power Pages via DirectLine SDK

Product Search

JavaScript DirectLine SDK is the bridge

DirectLine SDK

The JavaScript SDK lets your Power Pages site open a persistent channel to the Copilot Studio agent — no iFrame required.

Context Variables

On every page load, JavaScript may send context variables to the agent, for instance, the current page name and displayed product to the agent — so it always knows what the customer is looking at.

Cart Actions

The agent sends Adaptive Card actions back to the page. When the user clicks on an adaptive card button, JavaScript intercepts it and calls Power Automate flows to add, remove, or update cart items.

INTERACTION FLOW

Add to Cart: *Adaptive Card Event* [Agent → Web]

How the web capture agent events and do actions

Adaptive Cards as the UI

The agent renders buttons and selections directly inside the chat. No custom frontend work required.

Event Capture Layer

A thin JavaScript library on the Power Pages side listens for Adaptive Card submit actions and routes them to the right function.

Power Automate for Execution

Each cart action triggers a Power Automate flow that reads and writes Dataverse — keeping business logic server-side and secure.

JavaScript Activity Callback

```
directLine.activity$.subscribe(activity => {  
    if(activity.value &&  
        getDifferenceInMS(activity.localTimestamp) <= 500){  
  
        const evt = new CustomEvent("copilot.event", {  
            detail: activity,  
            bubbles: true,  
            cancelable: true  
        });  
        document.dispatchEvent(evt);  
  
    }  
})
```

Add to Cart: *Power Pages Javascript Interaction Layer*

Capture events triggered by the agent and do actions on the web page

Adaptive Cards as the UI

The agent renders buttons and selections directly inside the chat. No custom frontend work required.

Event Capture Layer

A thin JavaScript library on the Power Pages side listens for Adaptive Card submit actions and routes them to the right function.

Power Automate for Execution

Each cart action triggers a Power Automate flow that reads and writes Dataverse — keeping business logic server-side and secure.

JavaScript Activity Callback

```
document.addEventListener("copilot.event", (e) => {  
  
    switch(e.detail.value.type){  
        case 'AddToCart':  
            custom_AddToCart(e.detail.value.ID, 1,  
window["Microsoft"].Dynamic365.Portal.User.contactId);  
            break;  
        case 'OpenUrl':  
            window.location = e.detail.value.url;  
            break;  
    }  
});
```

Sending Events: Web -> Agent

How the web send an event to the agent, and it can fill a form, or make a product comparison report

Code Example: Agent → Web

```
function sendEventToBot(evName, data){

  directLine.postActivity({
    from: {id: 'user'},
    type: 'event',
    name: evName,
    value: data
  }).subscribe(
    response => {
      console.log(`✅ Message sent. Waiting for bot response...`, response);
    },
    error => console.error(`❌ Error sending message:`,
error)
  );
}
```

Product Info & Reviews

When a customer lands on a product page, the page fires a DirectLine activity containing the product ID, name, and category. The agent immediately uses this to personalize its first message.

Page-Aware Conversations

No more "Which product are you asking about?" The agent already knows. Context variables like `productId` and `currentPage` are updated on every navigation event.

Web page update actions

Web page can generate an event to find customer information through the agent, then the agent generates an event back to auto-fill a form.

Act 3: The Comparison Engine

Microsoft Foundry agent — where decisions get made

Microsoft Foundry: Intelligent Product Comparison

Why a second agent? Because comparison needs deeper reasoning.

Reasoning Beyond Lookup

Copilot Studio retrieves products. Foundry reasons over them — weighing specifications, trade-offs, and customer stated needs to produce a ranked recommendation.

Bing Search Grounding

The Foundry agent can retrieve live external data (reviews, price comparisons, availability) to supplement what is in Dataverse — giving customers richer context.

Structured Output to UI

Foundry returns a JSON comparison table that Power Pages renders as a structured card — not a wall of text, but a scannable decision tool.

Comparison Flow

Act 4: The Future is Already Here

WebMCP — what Microsoft + Google are building next

Copilot Studio & Power Pages evolves...

New Agent API (preview)

- Custom chat experiences:** Match your site branding and UX.
- Context-aware conversations:** Provide context about the page or process the user is interacting with.
- Infuse intelligence beyond chat:** Use custom-built Copilot Studio agents to power intelligent capabilities across the site, such as summarizing content, helping users understand complex information, help users fill forms with AI intelligence, ask agents to execute tasks, and more.

Beyond DirectLine: Introducing WebMCP

Microsoft + Google are collaborating on the next standard for AI–web interaction

Microsoft + Google = WebMCP (Preview)

What it is

A W3C proposal that lets AI agents interact with web pages through well-defined JavaScript tools — instead of screen-scraping or UI automation.

Why it matters for you

Every tool you build today with DirectLine + custom JS is exactly the pattern WebMCP will standardize. You are building the skills now.

Two modes

Declarative (HTML form attributes) and Imperative (`navigator.modelContext.registerTool`). Both let the page expose functions to any AI agent.

Status

Currently experimental in Chrome. Enable via `chrome://flags/#enable-webmcp-testing`. Not production-ready, but the direction is clear.

DirectLine vs WebMCP

	DirectLine	WebMCP
Agent type	Copilot Studio	Any AI agent
Integration	Custom JS SDK	Browser-native API
Context passing	Manual events	Automatic tools
Maintenance	Your code	W3C standard
Status	Production	Preview

github.com/webmachinelearning/webmcp

WebMCP – Interaction Flow

<https://github.com/webmachinelearning/webmcp>

WebMCP – Goals

- Enable human-in-the-loop workflows:** Support cooperative scenarios where users work directly through delegating tasks to AI agents or assistive technologies while maintaining visibility and control over the web page(s).
- Simplify AI agent integration:** Enable AI agents to be more reliable and helpful by interacting with web sites through well-defined JavaScript tools instead of through UI actuation.
- Minimize developer burden:** Any task that a user can accomplish through a page's UI can be made into a tool by re-using much of the page's existing JavaScript code.
- Improve accessibility:** Provide a standardized way for assistive technologies to access web application functionality beyond what's available through traditional accessibility trees which are not widely implemented.

WebMCP – Declarative

```
<form toolname="search_products"
      tooldescription="Search the product catalog by keyword and optional
category filter"
      action="/search" method="GET">

  <label for="query">Search term</label>
  <input type="text" name="query" id="query" required
        toolparamtitle="Search Query" toolparamdescription="The keyword or
phrase to search for in product titles and descriptions">

  <label for="category">Category</label>
  <select name="category" id="category"
        toolparamtitle="Product Category"
        toolparamdescription="Filter results to a specific product category.
Use 'all' for no filter.">
    <option value="all">All categories</option>
    <option value="electronics">Electronics</option>
    <option value="books">Books</option>
    <option value="clothing">Clothing</option>
  </select>

  <button type="submit">Search</button>
</form>
```

WebMCP – Imperative

```
function onUserLogin(user) {
  navigator.modelContext.registerTool({
    name: "viewOrderHistory",
    description: "Show the user's past orders with dates and totals",
    inputSchema: {
      type: "object",
      properties: {
        limit: {
          type: "number",
          description: "Maximum number of orders to return. Defaults to 10."
        }
      }
    },
    execute: async ({ limit = 10 }) => {
      const orders = await fetchOrders(user.id, limit);
      return {
        content: [{ type: "text", text: JSON.stringify(orders) }]
      };
    }
  });
}

function onUserLogout() {
  navigator.modelContext.unregisterTool("viewOrderHistory");
}
```

WebMCP – How to try

1. Enable WebMCP experimental flag in Chrome

Navigate to `chrome://flags/#enable-webmcp-testing` in the address bar.

Set the "WebMCP for testing" flag to **Enabled**.

Click **Relaunch** at the bottom of the page.

2. Install WebMCP – Model Context Tool Inspector Extension

[WebMCP - Model Context Tool Inspector - Chrome Web Store](#)

<https://chromewebstore.google.com/detail/webmcp-model-context-tool/gbpdfapgefenggkahomfgkhfehlcenpd>

3. Test it

Using your own code or try it with [WebMCP Travel](#) *Google demo*

<https://googlechromelabs.github.io/webmcp-tools/demos/react-flightsearch/>

⚠ NOT PRODUCTION READY, SPEC MAY CHANGE ⚠

What You Are Taking Home

1

Power Pages + Copilot Studio is production-ready today

DirectLine SDK + context variables gives you full, bidirectional, context-aware AI in any Power Pages site.

2

Two agents are better than one

Let Copilot Studio handle conversation and search. Use Azure AI Foundry for tasks that need deeper reasoning, external data, or structured output.

3

Adaptive Cards are your secret weapon

They bridge the gap between conversation and action — the agent issues commands, the page executes them, Dataverse records them.

4

The pattern you built here IS the future standard

WebMCP is the W3C standardization of exactly what you are doing today. You are ahead of the curve.

Resources & Next Steps

Everything you need to build this yourself

Agent API for Power Pages (Preview)

Official Microsoft blog post — Power Pages Agent API announcement and documentation

WebMCP Specification (W3C)

The emerging standard for AI–web interaction — try it in Chrome today

github.com/webmachinelearning/webmcp

One last thing....

Evolution of LLM-based Solutions

No Agent
Very narrow one shot task

Ex: log to JSON

Single Agent
Very clearly scoped iterative task

Ex: providing an answer with supporting evidence to a complex question

Multi-agent Systems
Wide scope complex use case requiring diverse skills

Ex: Propose 2 Instagram marketing campaigns including assets that would leverage the top 2 recent trends in our past quarter US Sales to boost our mailing list user base and predict the impact of each campaign

VALUE

THANK YOU!

We Appreciate your Feedback

Thank you for joining us today.
